

**Recombinant NIE Antigen From *Strongyloides stercoralis****Description of Technology:*

*Strongyloides stercoralis* is an intestinal nematode endemic that affects an estimated 30 to 100 million people worldwide. Many of these individuals may be asymptomatic for decades. The present invention discloses a NIE recombinant antigen that can be used in improved assays and diagnostics for *S. stercoralis* infection. The NIE antigen is the only one that is non-cross-reactive with sera from humans with other related filaria infections. The NIE antigen can be utilized as a skin test antigen for immediate hypersensitivity as well as for use in ELISA or other assays.

*Potential Commercial Applications:*

Assays and diagnostics for *S. stercoralis* infection.

*Competitive Advantages:*

- Only non-cross-reactive *Strongyloides* antigen
- Use in a variety of formats

*Development Stage:*

- Prototype
- Pilot
- Pre-clinical
- In vitro data available
- In vivo data available (human).

**Therapeutic Hepatitis C Virus Antibodies***Description of Technology:*

Therapeutic antibodies against Hepatitis C Virus (HCV) have not been very effective in the past and there is evidence that this may result in part from interfering antibodies generated during infection that block the action of neutralizing antibodies. These neutralizing antibodies prevent HCV infection of a host cell.

The subject technologies are monoclonal antibodies against HCV that can neutralize different genotypes of HCV. Both antibodies bind to the envelope (E2) protein of HCV found on the surface of the virus. One of the monoclonal antibodies neutralizes HCV genotype 1a, the most prevalent HCV strain in the U.S., infection and *in vitro* data show that it is not blocked by interfering antibodies. The second antibody binds a conserved region of E2 and can cross neutralize a number of genotypes including genotypes 1a and 2a. The monoclonal antibodies have the potential to be developed either alone or in combination into therapeutic antibodies that prevent or treat HCV infection. These antibodies may be particularly suited for preventing HCV re-infection in HCV patients who undergo liver transplants; a population of patients that is especially vulnerable to the side effects of current treatments for HCV infection.

*Potential Commercial Applications:* Therapeutic antibodies for the prevention and/or treatment of HCV infection.

*Competitive Advantages:*

- Therapeutic antibodies have generally fewer side effects than current treatments for HCV infection.
- Potential to be developed into an alternative treatment for HCV infected liver transplant patients, who often cannot tolerate the side effects of current drug treatments.

*Development Stage:*

- Early-stage
- Pre-clinical
- In vitro data available
