

rhabdomyosarcoma, and prostate, ovarian, colorectal, and lung cancers.

Competitive Advantages:

- High affinity of the CARs increases the likelihood of successful targeting.
- Targeted therapy decreases non-specific killing of healthy, essential cells, resulting in fewer non-specific side-effects and healthier patients.

Development Stage:

- Early-stage.
- In vitro data available.

Bispecific Antibodies To Target Latent HIV-1 Infection

Description of Technology: The invention describes bispecific antibodies designed to kill latently HIV-1 infected T cells. It is thought that such bispecific antibodies will reduce or eliminate the pool of HIV-1 infected cells, contributing to functional cure. The antibody constructs comprise an HIV Env-binding fragment of a broadly neutralizing antibody linked to an anti-CD3 single chain variable fragment (scFv). One embodiment is a VRC01 scFv linked to the anti-CD3 scFv. Other embodiments comprise Fab fragments of VRC07 or 10E8 antibodies linked to the anti-CD3 scFv. The bispecific antibody simultaneously stimulates infected cells to express gp120, instructs cytotoxic T cells to kill these cells, and neutralizes extraneous viral particles.

Potential Commercial Applications: Immunotherapy of HAART-suppressed HIV-1 infection.

Competitive Advantages:

- Immunotherapy targets latently infected cells harboring virus resistant to HAART.
- Broadly neutralizing antibody fragment neutralizes extraneous viral particles.

Development Stage:

- Pre-clinical.
- In vivo data available (animal).
